

10 Reasons to purchase a RTx remote controlled padfoot roller.

1. You can't beat experience!
2. The infrared remote control system provides maximum safety: The operator is protected from vibrations, noise and dust. The machine can only be operated if line of sight is intact. In case of a loss of control the proximity recognition sensor keeps the operator safe.
3. The lower section is completely maintenance free, because the drive system and exciter are provided with a permanent lubrication. That makes it very economical to run throughout its whole service life.
4. The below the axle exciter in each drum allows for more efficient transfer of compaction energy to the soil for superior compaction results. In addition, the low position of the exciters improves the stability of the machine and lowers the risk of the device toppling over.
5. The articulated joint increases the maneuverability around curved building segments, such as manhole covers, without tearing up the ground that has just been compacted.
6. RTx-SC3 - two rollers in one: The attachment drums allow for an easy change between 82 and 56cm.
7. The engine control module with diagnostic LEDs monitors machine functions such as oil pressure, radiator level, engine temperature, glow plug, battery and air filter capacity.
8. 3 x Infrared receiving eyes front centre and rear.
9. Fibre glass bonnets ensure the machine looks good for many years, no rust spots.
10. Heavy duty, centrally positioned crane lifting point.
